## Measurement Instructions for Standard, Elliptical, or Custom Insta Arches

To measure any doorway for a Standard, Elliptical, or Custom Insta Arch, follow these few simple steps.

Stretch the measuring tape from the wood surface of the doorway to the opposite side of the framed doorway in any desired opening.

For Example: The “rough” opening for a 36” inches Insta Arch is actually 37” inches in length.

Once applying a layer of ½” drywall to both sides of the doorway, a 36” inch opening is achieved and ready for an Insta Arch to be installed.

The most accurate manner in which to measure the depth of an Insta Arch is by measuring across the door jam including both sides of the drywall. Above depicts the measurement for a 2x4 framed doorway with ½” drywall on both sides making the depth 4 ½” inches.

For instance, the same rule applies for 2x6 framing with ½” drywall on both sides. The finished opening is 6 ½” inches. Use the same method when measuring any other desired Custom size doorway for *“A Perfect Arch In Fifteen Minutes”*.
